

INSTRUCTIONS FOR THE SUBMISSION OF YOUR WORK

Please take note of the following important deadlines and project submission requirements.

Your **Sololearn certificate** should be ready and submitted by **Monday, 29th June 2026**. This should be printed on an egg shell paper in colour. Write your Index number at the back, top right. The certificate should bear your official name. It should be at the intermediate level.

The **final part of your project work** should also be completed and submitted by **Friday, 17th July 2026**.

For the final project, each group is expected to develop a working **application that interfaces with your database**. You may use any programming language or development tool of your choice, such as Python, Java, PHP, C#, Visual Basic, JavaScript, or any other suitable language.

Your application should be able to connect to the database and perform meaningful operations based on your project scenario. At minimum, the application should demonstrate how data can be added, viewed, updated, deleted, searched, or processed through the system.

You are also required to clearly highlight the **reports that will be generated by the application**. These reports should be useful to the organisation or users in your chosen scenario. For example, your application may generate reports on students, customers, sales, payments, attendance, inventory, appointments, transactions, or any other relevant records depending on your project topic.

The mode of submission remains the same as the previous project. Each group should submit the following:

1. A short video introducing the group members and briefly explaining each member's role in the project.
2. A screen-recorded video demonstrating the application and database. The video should show how the application connects to the database, how users interact with the system, and how the main features work.
3. A demonstration of the reports generated by the application, with a brief explanation of the usefulness of each report.
4. The SQL script used to create the database, tables, relationships, constraints, and sample data.
5. The application source code and any required project files.
6. The final project report, where applicable.

All files should be properly organised and labelled with the group name, project title, and names of group members and their contact numbers.

Please ensure that your work is complete, well-tested, and submitted on or before the deadline. Late submissions may not be accepted unless there is a genuine reason communicated early.

Thank you.
